A glimpse on Pepe Bonet's work

Manuel Maestre

Universidad de Valencia

In this talk I will try to present a small part of Pepe's mathematical research work that, up today, consists of 262 published papers and two books, apart of his big job as editor of several journals (and books).

I will highlight a few of his results on Fréchet, DF-spaces, (LF)-spaces, weighted spaces of holomorphic functions, spaces of ultradifferentiable functions, homological methods, hypercyclicity, and many, many, papers on composition operators.
