We shall provide a precise answer to Lindenstrauss' Question 18 in [4]. Moreover, the Banach space  $E$  admits an equivalent LUR norm on any subset of  $S_E$  contained in a family  $\mathcal{F}$  of  $\sigma(E, E^*)$ -compact and separable faces such that

$$\mathcal{F} = \bigcup_{n=1}^{\infty} \mathcal{F}_n$$

where every one of the families  $\mathcal{F}_n$  is a subfamily of disjoint faces. Completely new results are obtained when compactness is replaced by a new condition in terms of pressing down on separable faces without touching disjoint ones, i.e. what we call to have a perfectly pumped ball with separable faces is going to characterize the fact to have an equivalent LUR norm.

For a Banach space  $E$  with a Fréchet differentiable norm we shall deal with the existence of an equivalent LUR norm which will provide us our Jubilee Theorem for Pepe.

This is a joint research with Vicente Montesinos.
